

# Incorporating Mixed Stock Information into Assessment and Management

**Lisa Kerr**

Gulf of Maine Research Institute  
CAPAM Meeting, October 1, 2018

**Gulf of Maine  
Research Institute**

Science. Education. Community.

- Overview of the implications of stock mixing.
- Insights on origin from mixed stock analysis.
- Integration of stock composition analysis into assessment and management.
- Case studies illustrating approaches to integration of stock composition information.

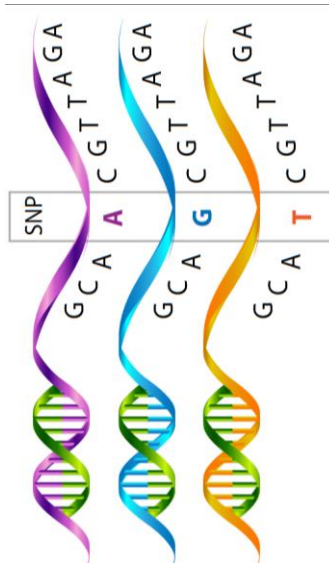

# Prevalence of Mixed Stock Fisheries

- In many instances, the spatial scale of stocks were defined based on the state of knowledge in the 1960s-1970s.
- The more we “look” using more sophisticated methods, the more we realize that there are mismatches in the scale of biological populations and management units.
- As a result, there are many instances of mixed stock fisheries which exploit fish from different origins.

## Genetics

## Electronic Tagging

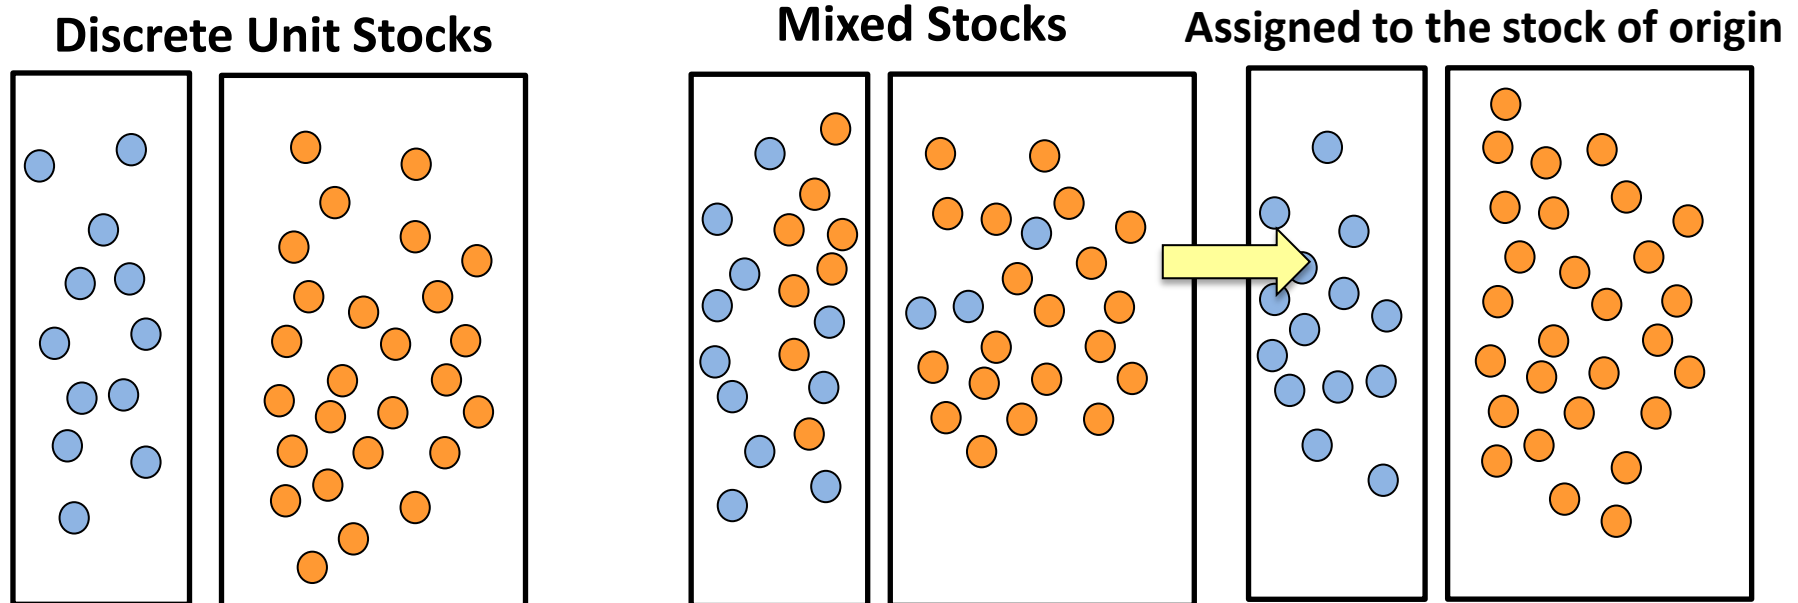

## Otolith Chemistry

# The Unit Stock Assumption

For management purposes, stocks are considered discrete units that can be exploited independently.

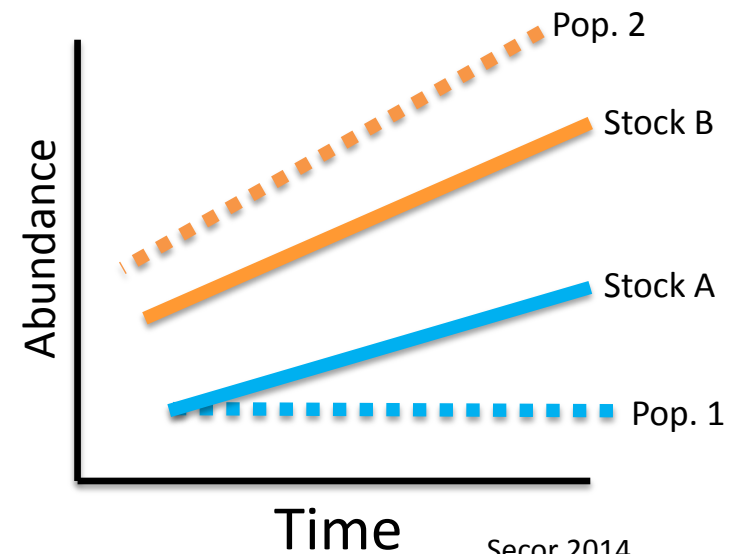

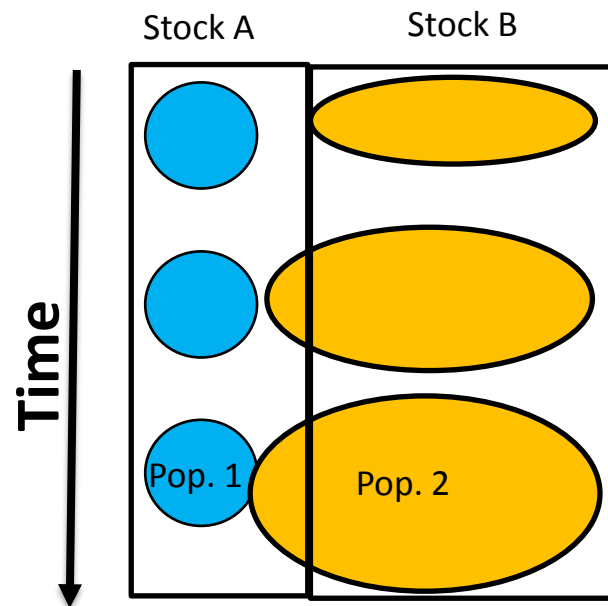

If harvest occurs on a mixed stock, catches should be assigned to the stock of origin.

# Implications of Ignoring Stock Mixing

Ignoring stock mixing can confound our perception of a stock.

- **Catch:** estimates of fishing mortality.
- **Indices of abundance:** conclusions on stock size
- **Stock-recruit relationships:** expectations of productivity
- **Life history parameters:** age-at-maturity, growth rate

# Implications of Ignoring Stock Mixing

# Mixed Stock Analysis

Mixed stock analysis using an established stock identification technique can enable quantification of the origin of fish across broad spatial and temporal scales.

**Genotypic or phenotypic traits or a combination of both can be used to determine origin.**

**Natural Tags can act like birth certificates for the fish**

- Like a conventional tag...you know where fish were caught and “tagged”
- But...the location of “tagging” is the spawning/nursery area and the whole population was “tagged”.
- Mixed stock information reflects the result of mixing rates and the relative local abundance of populations.

*Otolith chemistry can provide “tracks” of movement akin to electronic tags depending on chemical characteristics of the system.*

CLEM SCALZITTI

# Mixed Stock Analysis of Atlantic Bluefin tuna

Gulf of Maine Fish  
N = 789

A decorative topographic map background with contour lines and elevation markers (e.g., 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000) is visible at the top of the slide.

# Logistics of Mixed Stock Analysis

- Baselines
  - Known-origin fish establish signatures of populations.
  - Sufficient differences in traits must be detected.
  - All sources must be characterized.
  - Baselines should include multiple years and be updated.
- Mixed stock sample
  - Important consideration in sampling design: where are you sampling and when?
    - Fishery independent, fishery dependent sampling
    - Years, season
    - Life stage and period in life history (feeding, spawning. etc.)
- Statistical approach for classification of source.

A topographic map of a coastal region, likely the Gulf of Maine, showing contour lines and elevation markers. The map is partially obscured by the title and logo.

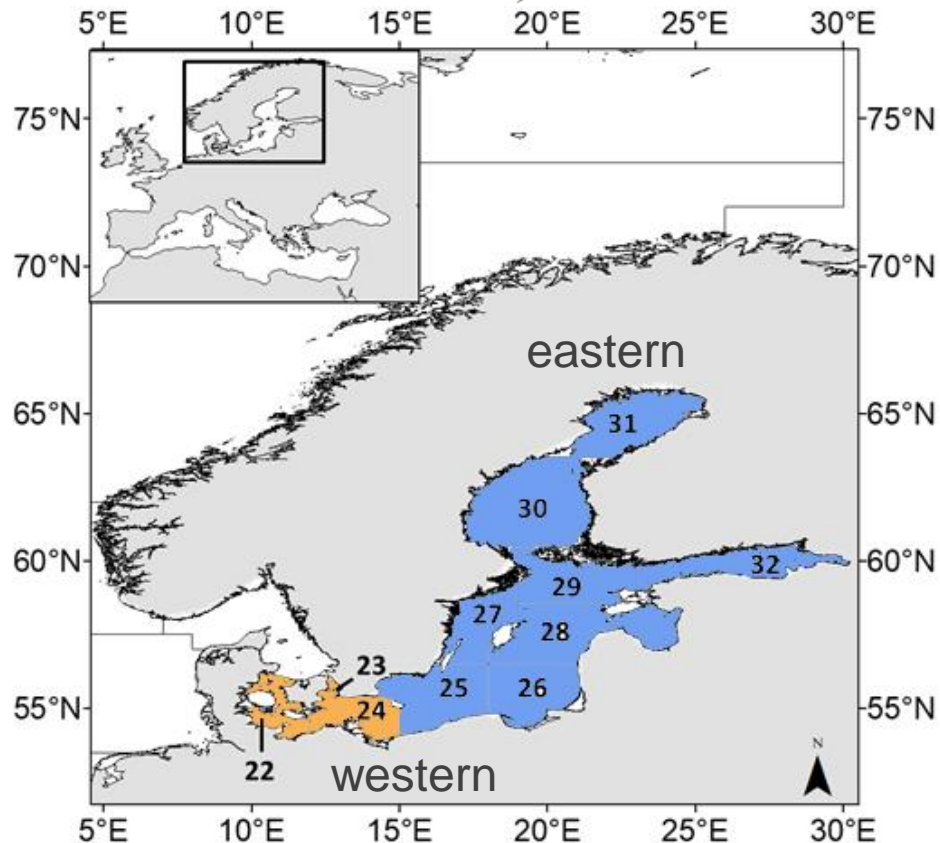

# What are Our Options for Integrating Stock Composition Information?

- I. Revising data to inform stock assessment.
- II. Integrating information into stock assessment.
- III. Changing the scale of the stock assessment and/or management.

# I. Revising data to inform assessment

## Eastern and western Baltic cod

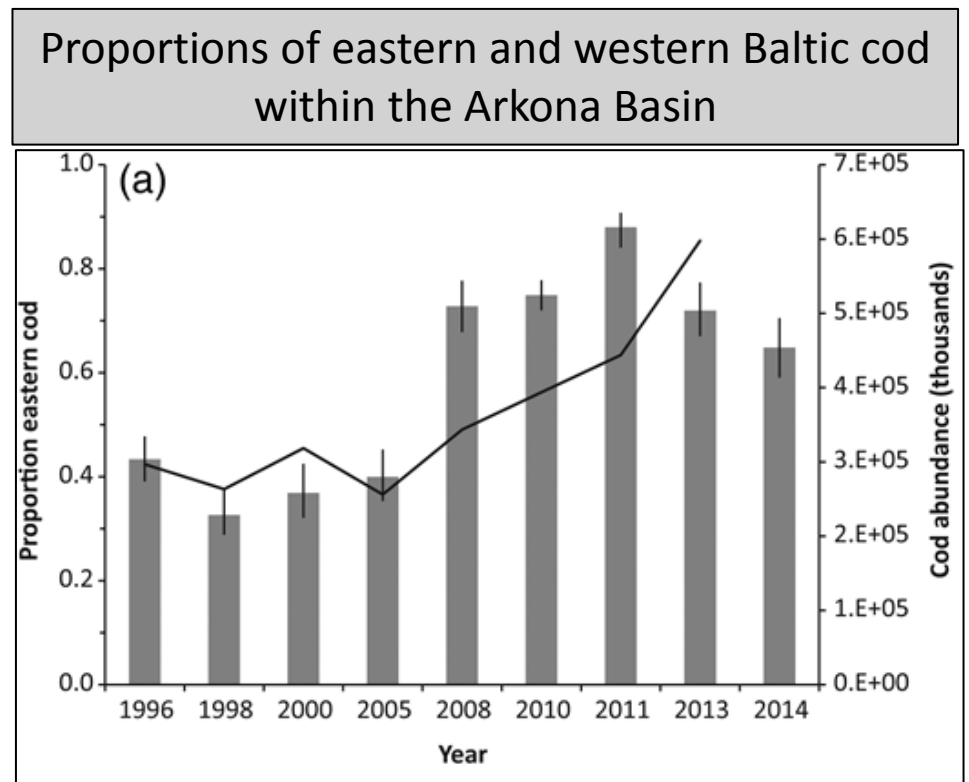

- Two cod populations occur in the Baltic Sea and are assessed and managed as separate stocks: eastern and western Baltic cod.
- Stock mixing has been documented in the Arkona Basin (ICES Area 24)
- Because of lower stock size of western Baltic cod, concern exists about the potential for local depletion

# I. Revising data to inform assessment

## Eastern and Western Baltic cod

- Application of otolith shape analysis to archived otoliths
- In 2015, eastern and western Baltic cod stock assessments incorporated information on the proportion of eastern fish within the western stock area.

# I. Revising data to inform assessment

## Eastern and Western Baltic cod

### Western Baltic Stock Assessment

Age-based analytical assessment (SAM)

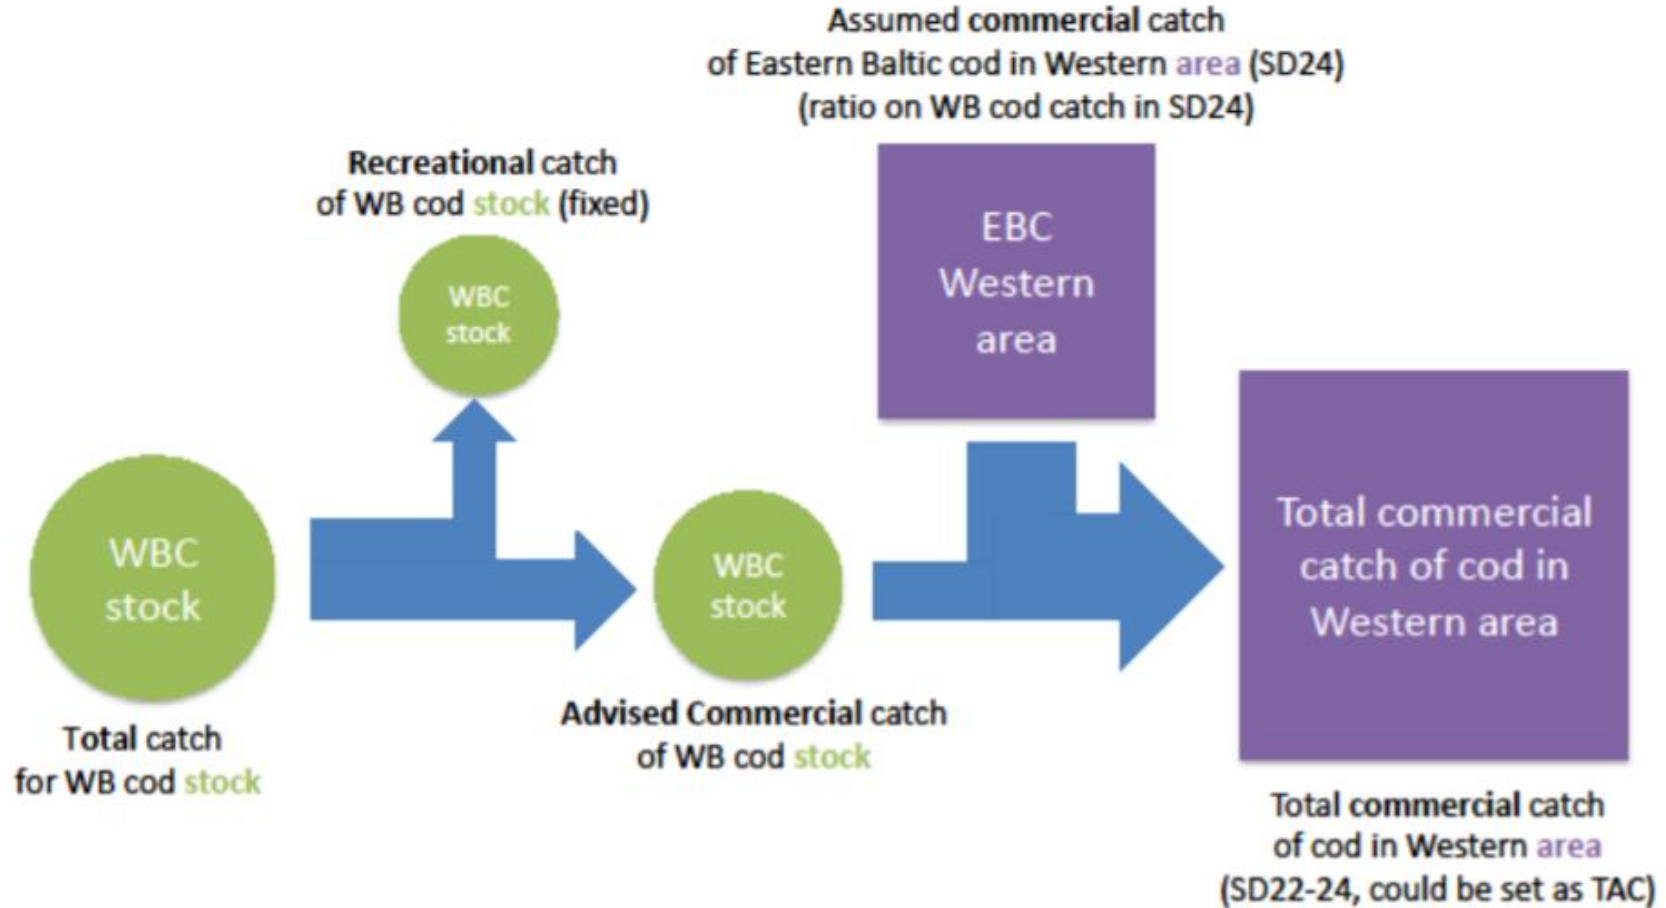

Mixed stock assessment gave perception of higher biomass, lower exploitation, and higher productivity for **western Baltic cod**.

# I. Revising data to inform assessment

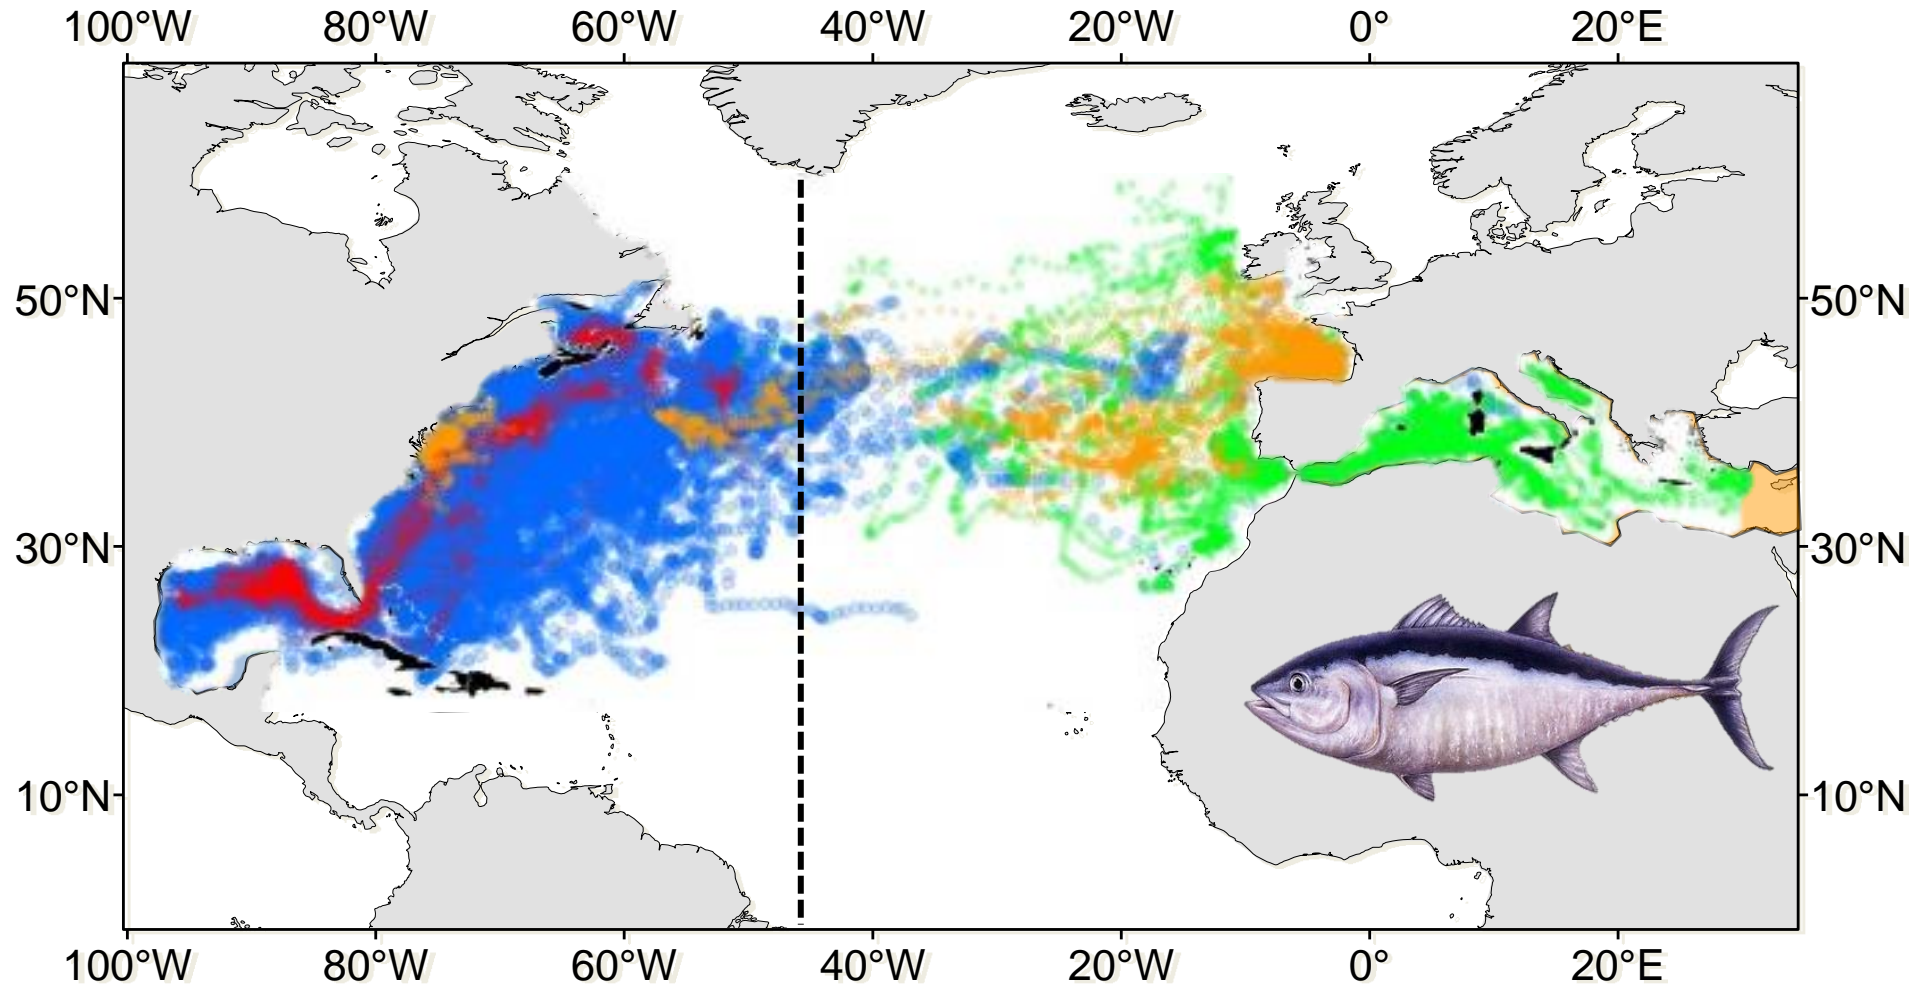

## Western Baltic Cod Advice

*Approach to move from western Baltic cod advice to area-based advice that incorporates mixing.*

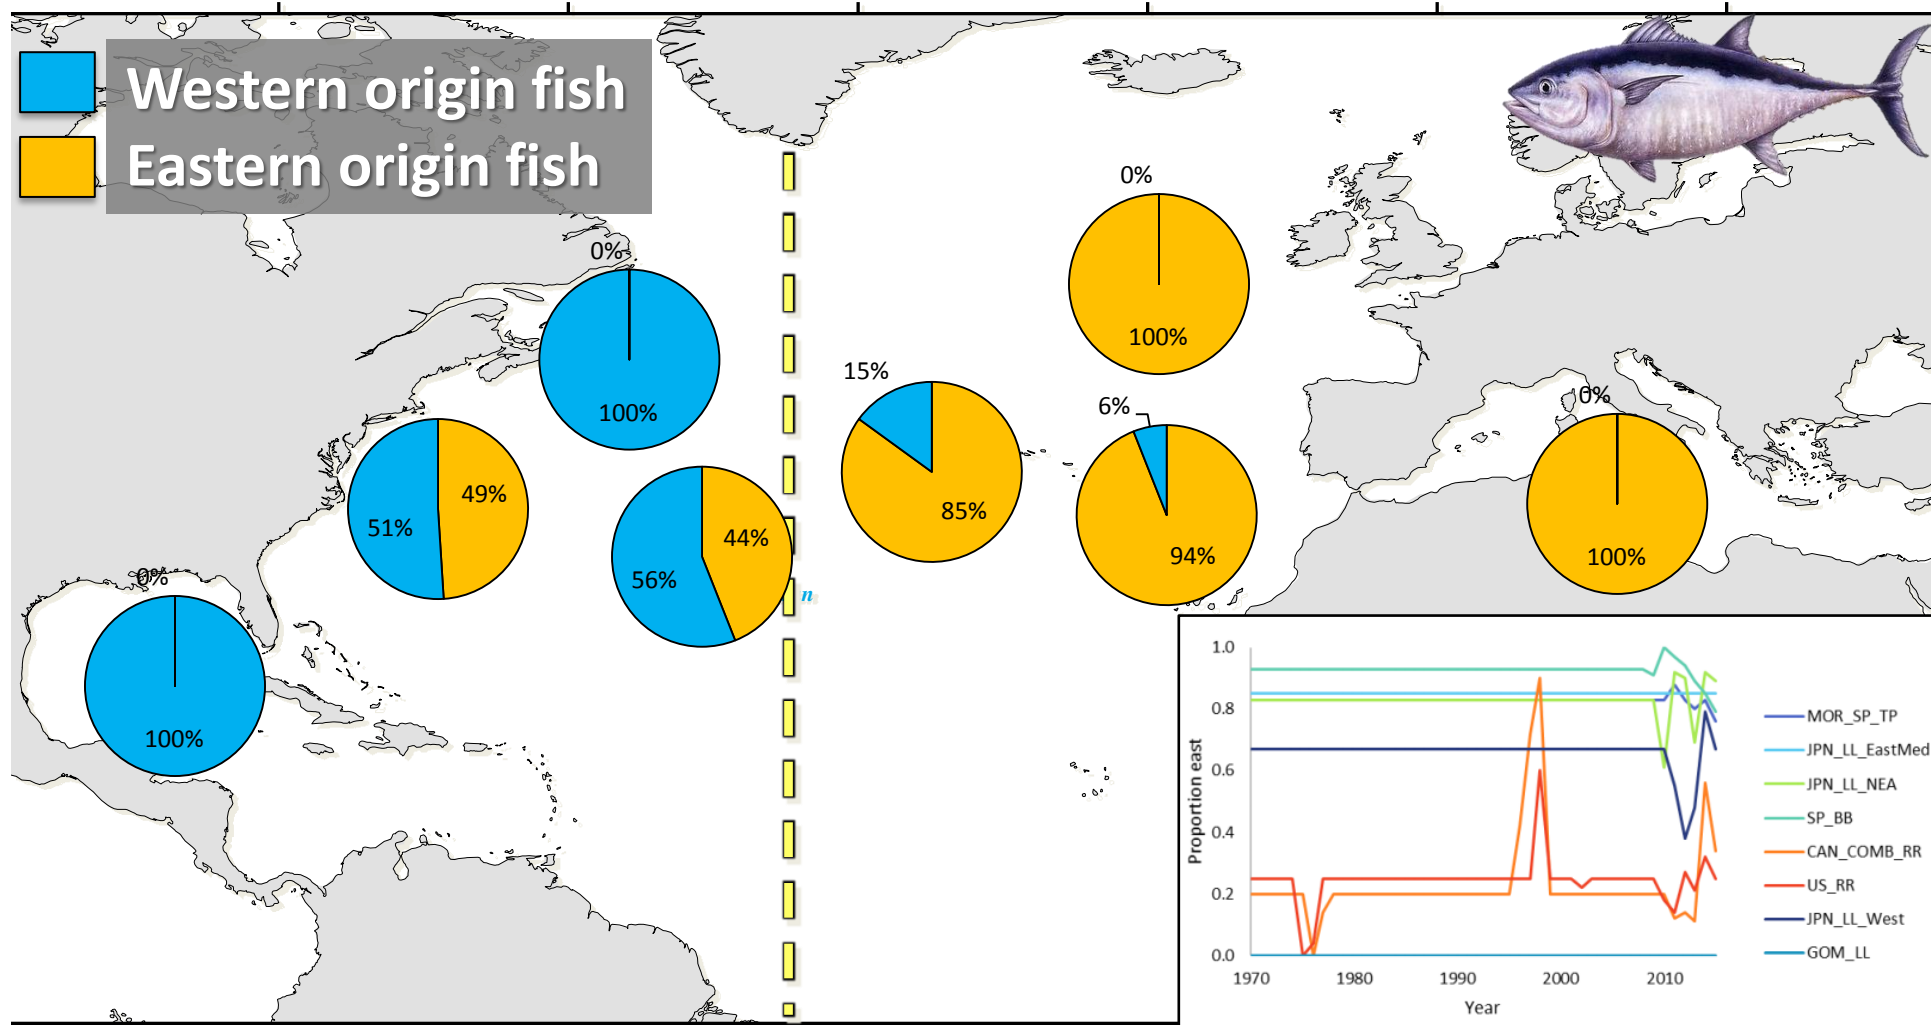

# I. Revising data to inform assessment

## Atlantic Bluefin Tuna

# I. Revising data to inform assessment

## Atlantic Bluefin Tuna

Otolith-based stock composition analysis is used to track changes in the relative abundance over space and time.

# I. Revising data to inform assessment

## Atlantic Bluefin Tuna

Total Catch

$$C_{W,t} = \sum C_{f,t} P_{f,t}$$

Catch at Age

$$C_{W,t,a} = \sum C_{f,t,a} P_{f,t,a}$$

Indices of Abundance

$$CPUE_{W,f,t} = CPUE_{f,t} \frac{\sum P_{f,t,a} C_{f,t,a} w_{t,a}}{\sum C_{f,t,a} w_{t,a}}$$

$P_f$  = proportion of western-origin fish by fishery

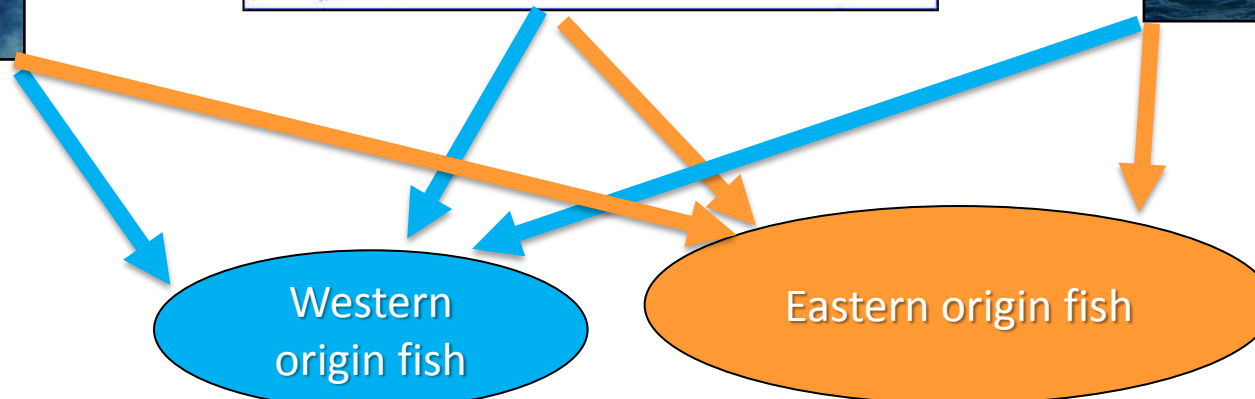

US rod and reel

Japanese Longline

Moroccan/Spanish Trap

# I. Revising data to inform assessment

## Atlantic Bluefin Tuna

### Revised Bluefin Tuna Stock Assessment (VPA)

Mixed stock assessment gave perception of lower spawning stock biomass, higher exploitation, and lower productivity for western bluefin tuna than population-of-origin assessment

# II. Integrating information into stock assessment

## Atlantic Bluefin Tuna Assessment

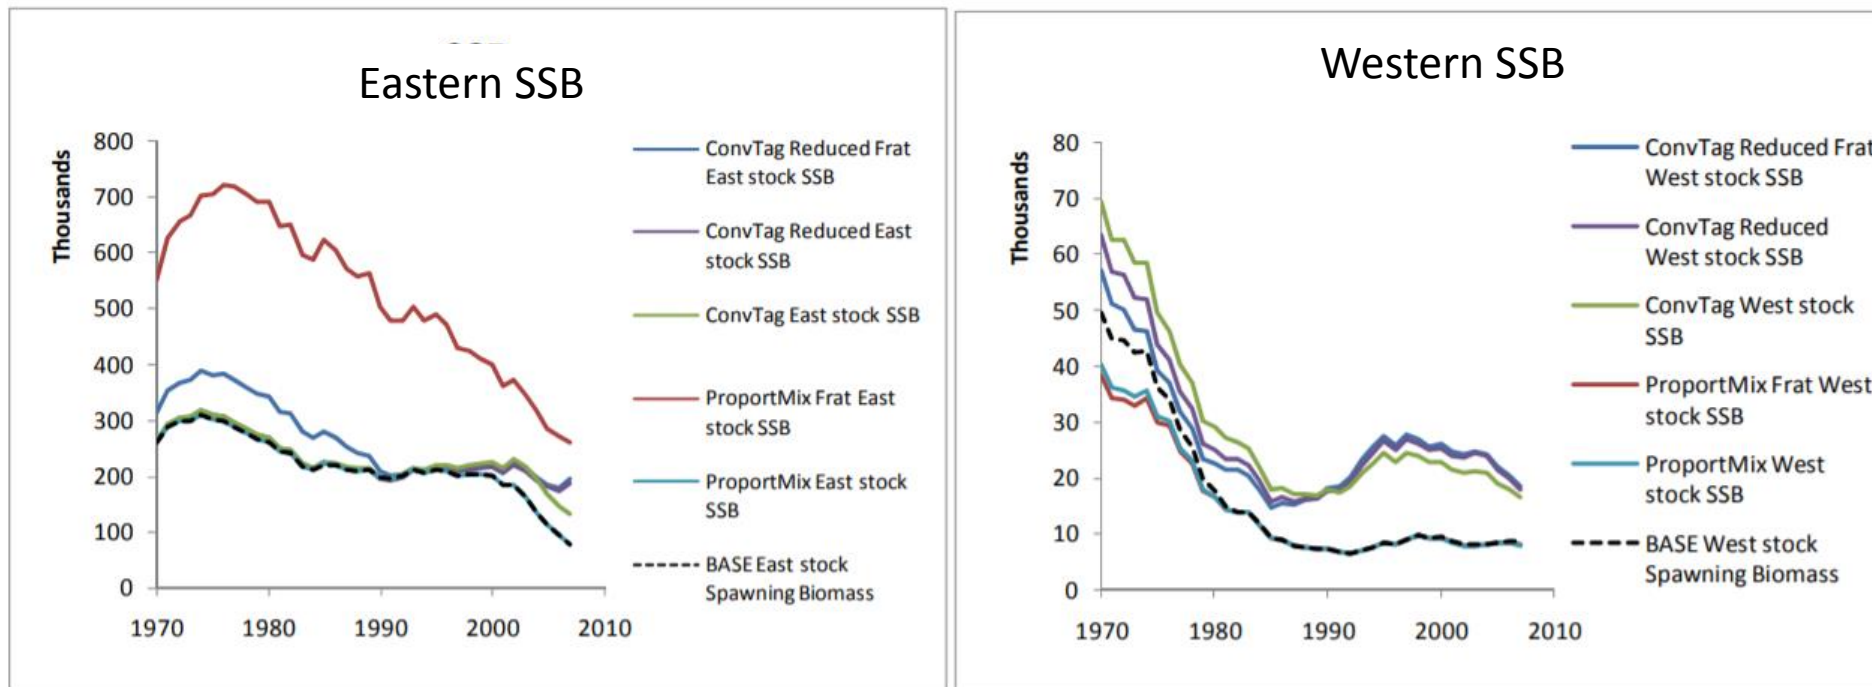

### VPA 2-box model

(Butterworth and Punt 1994, Porch et al. 1995, 2001; Porch 2003)

### Overlap Model

$$N_{s,t+1} = N_{s,t} \sum_k P_{s,k,t} e^{-(F_{k,t}+M)}$$

Stock composition is accounted for as the proportion of stock in an area at a specific time.

Model was fit to stock-composition ratios based on otolith chemistry and conventional tagging data.

# II. Integrating information into stock assessment

## Atlantic Bluefin Tuna Assessment

Multi-stock Age-Structured Tag-integrated assessment model (Taylor et al. 2011)

### Conventional Tags

ICCAT database

### Archival and PSAT Tags

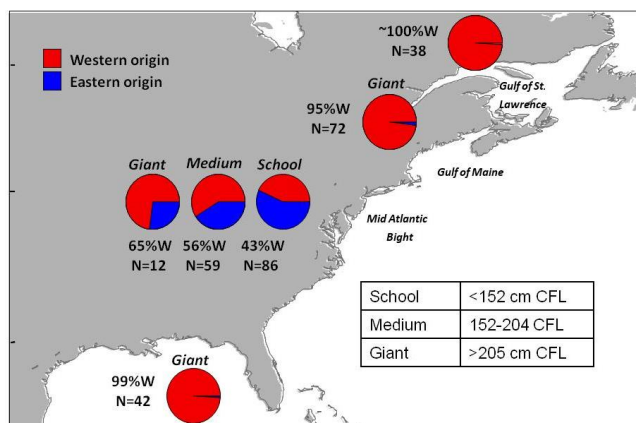

Block et al. 2001, 2005, Sibert 2006

Tagging data was used to parameterize seasonal movement matrices

### Otolith chemistry

Rooker et al. 2008

Model was fit to stock-composition ratios based on otolith chemistry

$$L_3 = \sum_{n_{os}} \log \left( \frac{Nos}{Kos} \right) + Kos \log(P_{oto}) + (Nos - Kos) \log(1 - P_{oto})$$

Nos=Number of western otoliths in a given sample  
 Kos=Total number of otoliths in a given sample  
 Poto=oto sample proportions

## II. Integrating information into stock assessment

### Great Lakes Whitefish MSE (Li et al. 2018)

- Goal: Test the benefits of including information on spawning origin for the management of intermixing whitefish populations.
- Overlap SCAA assessment model included information on population-specific harvest age composition
- Emulated information from genetic/otolith stock id method from a mixed harvest sample.
- Also explored uncertainty in data.

Population specific harvest age composition

$$p'_{j,y,i,a} = C'_{j,y,i,a} / \sum_{i,a} C'_{j,y,i,a}$$

Likelihood Function

$$\ell_{pa} = - \sum_j \sum_y N_{\text{eff}} \sum_{i,a} (\tilde{p}_{j,y,i,a} \log_e p'_{j,y,i,a})$$

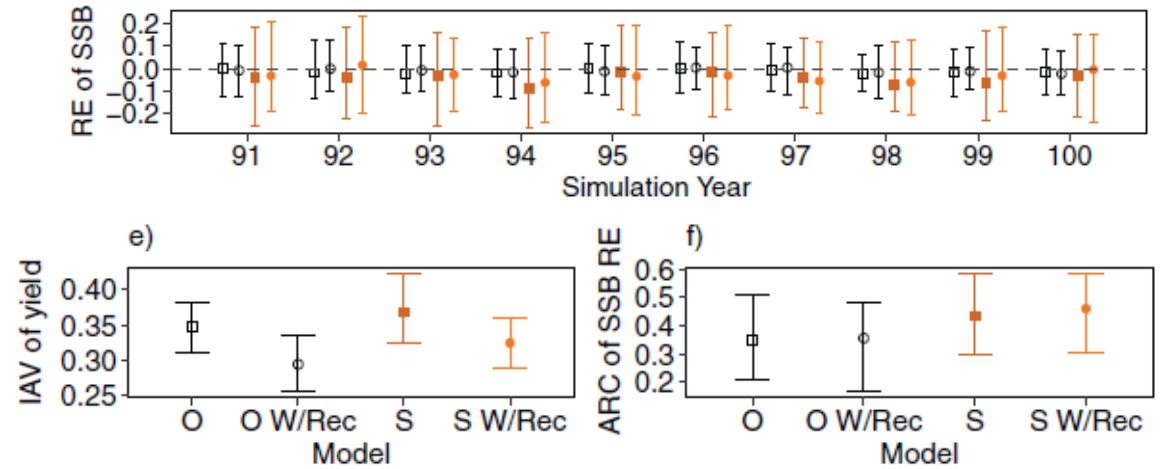

# II. Integrating information into stock assessment

## Great Lakes Whitefish MSE (Li et al. 2018)

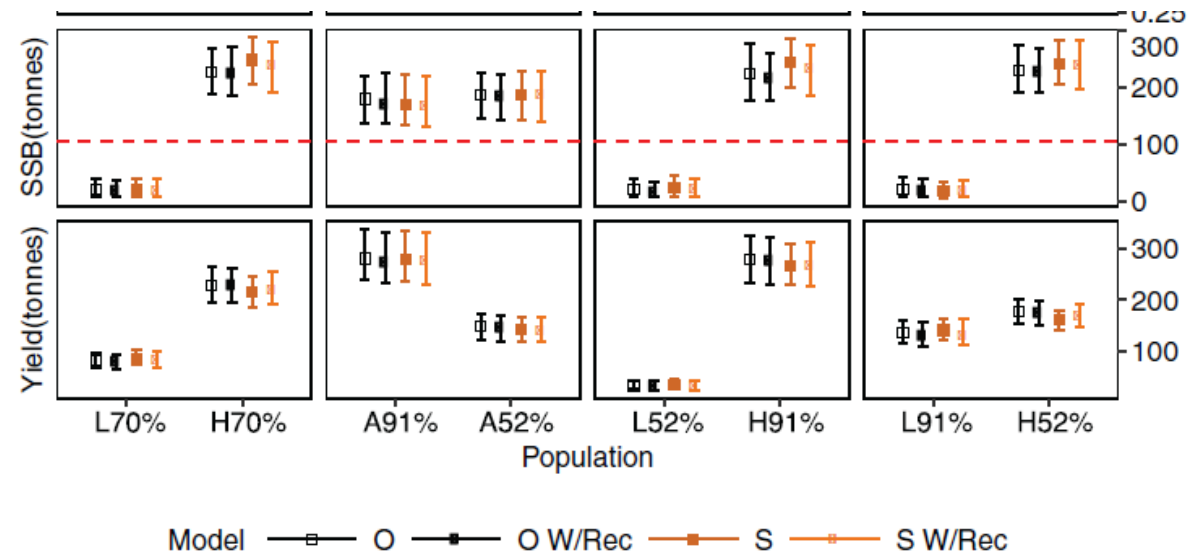

- Incorporating population-specific information improved assessment performance.

- However, improvements in assessments did not always translate to improved fishery management.

Assessment Performance Metrics

Management Performance Metrics

## II. Integrating information into stock assessment.

### Stock Synthesis

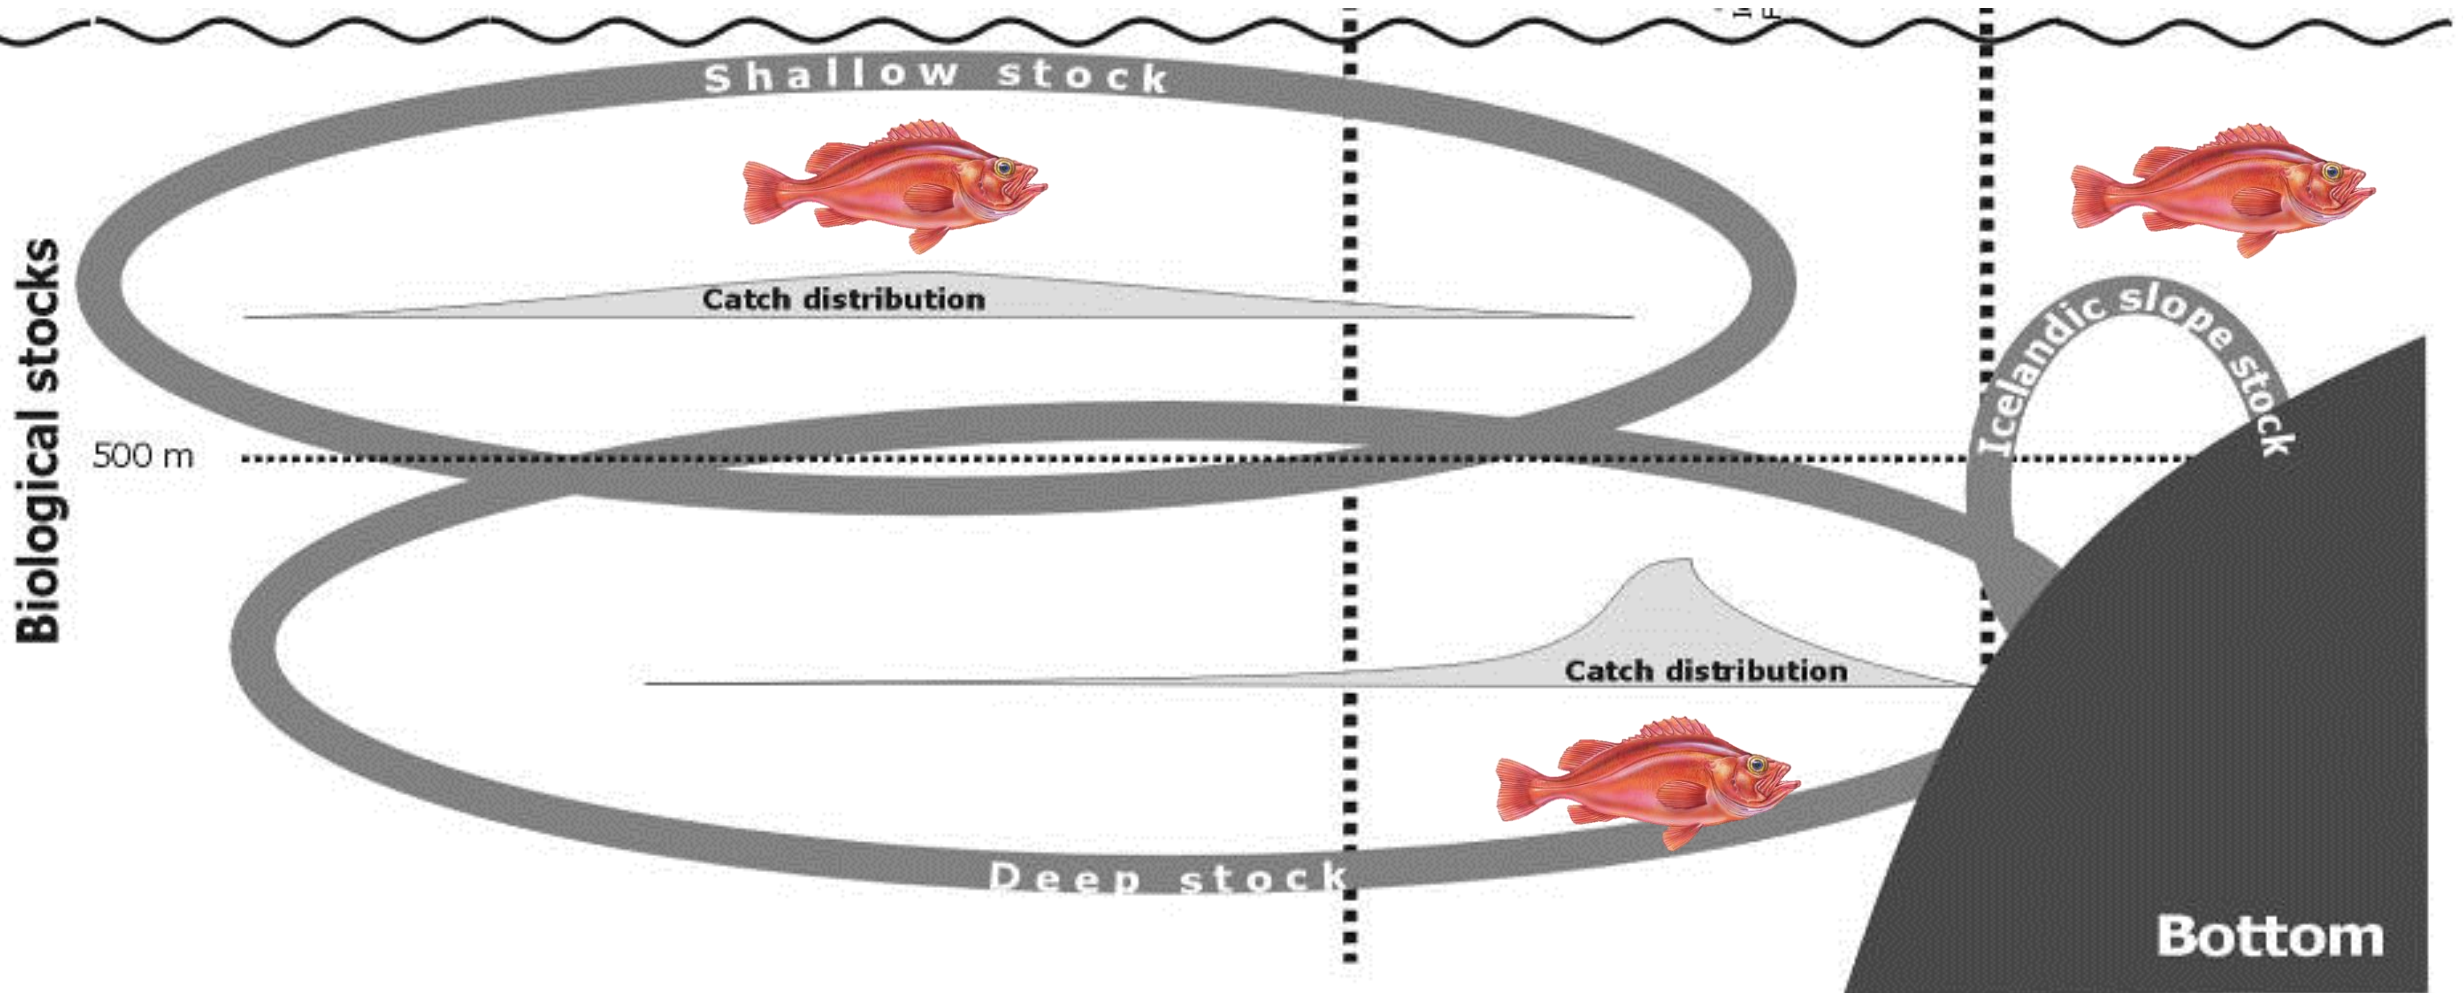

- Stock Synthesis can integrate stock composition information from genetics, otolith microchemistry, tags or other means.
- SS has the capability to calculate the expected proportion of a sample of fish that come from different growth patterns.

Stock composition data can be entered in SS as follows:

1	#Do morphcomp (if zero, then do not enter any further input below)							
COND = 1								
	3	#N observations						
	2	#N stocks						
	0.00001	#Mincomp						
	#Year	Seas	Fleet	partition	Nsamp	Data Vector		
	1980	1	1	0	36	.4	0.6	...
	1981	1	1	0	40	.44	0.62	....
	1982	1	1	0	50	.49	0.50	...

# III. Changing the scale of the stock assessment & management

## Beaked Redfish in the Irminger Sea

# III. Changing the scale of the stock assessment and management

## Beaked Redfish in the Irminger Sea

- Biological stocks of redfish were redefined by depth and habitat
- However, depth-defined management units would not be practical
- New spatially-defined management unit boundaries were redrawn to minimize mixed-stock catches.

- 1) "Deep Pelagic" management unit
- 2) "Shallow Pelagic" management unit
- 3) "Icelandic Slope" management unit

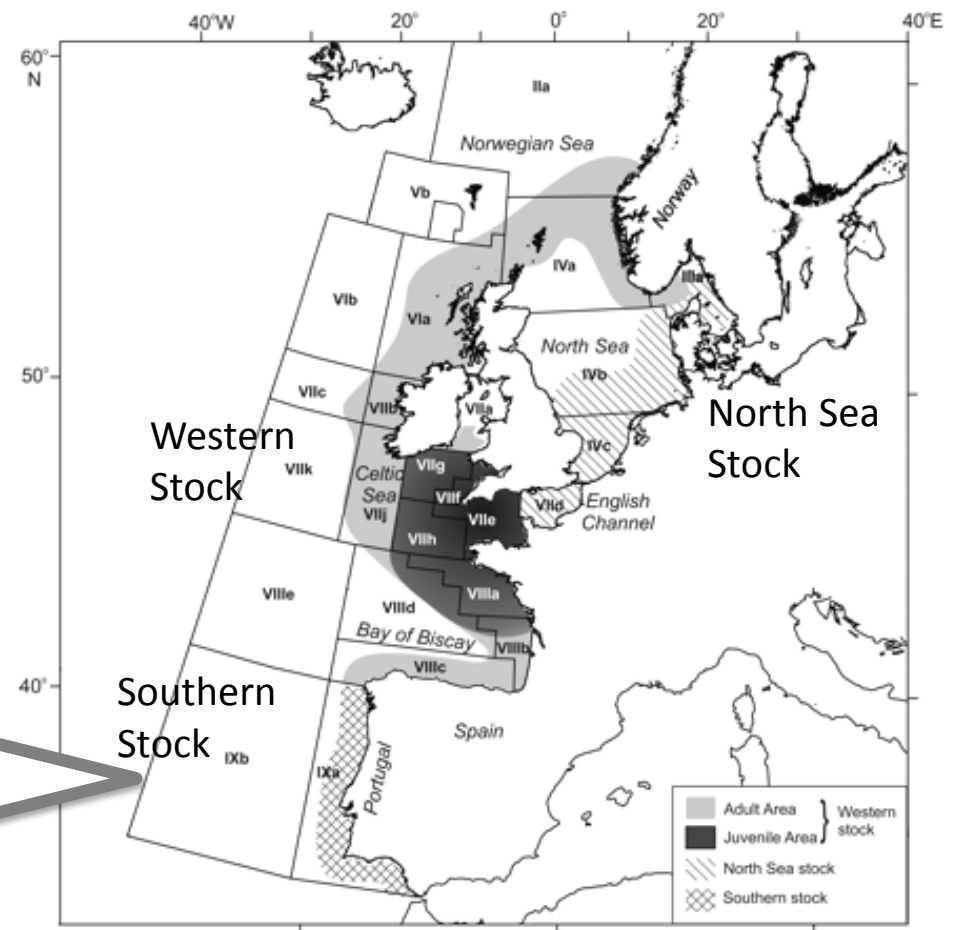

# III. Changing the scale of the stock assessment and management.

## Horse Mackerel

### Horse Mackerel Stock Identity Synthesis (HOMSIR)

*Adjustment to southern stock boundary to minimize mixed stock catch*

- Meeting the goal of sustainable management can be difficult when management units do not match the scale of fish biology.
  - Sustainability of the resource: overfishing
  - Profitability of the fishery: underfishing
  - Conservation or biodiversity goals: extirpation
- There are a range of approaches to improve assessment and management in situations where stock mixing occurs.
  - Revising data to inform assessment.
  - Integrating information into stock assessment.
  - Changing the scale of the stock assessment and/or management.
- But the critical component is data—we need stock identity and mixed stock analysis to inform these approaches.

A topographic map of a coastal region, likely the Gulf of Maine, showing contour lines and elevation markers. The map is partially obscured by the title and logo.

# Why don't we see this approach implemented often in U.S. Fisheries?

- ICES stocks have many more examples of integration of mixed stock analysis.
- This work has been supported by large-scale EU stock id projects
  - REDFISH: change in the boundaries of redfish management units
  - HOMSIR: change in boundaries of horse mackerel management units
  - WESTHER: evaluation of assessment and management strategies of the western herring stock.
  - SARDYN: no strong evidence that the assessment was biased by mixing; there were no changes to existing management units.
  - METACOD: three cod stocks are now defined in the region.
  - Benchmark on Sandeels: change in sandeel management units.

# Otoliths as Historical Records

*Archived otoliths can allow us to go back in time and reconstruct stock composition over time using genetics or otolith-based techniques.*
